All contraindications to Anisindione should be reserved for patients who cannot tolerate the coumarins. Like phenindione, to which it is related, Anisindione prevents the formation of blood clots in the body. It is indicated for the treatment of deep vein thrombosis and pulmonary embolism, and as an adjunct to heparin therapy for the management of unstable angina, myocardial infarction, and as an anticoagulant in cases where the use of heparin is contraindicated.

Anisindione is indicated for the prophylaxis and treatment of patients who are at risk of developing blood clots, such as those undergoing surgery, those with a history of blood clots, and those with a history of cancer.

Anisindione is also indicated for the treatment of unstable angina and myocardial infarction, as well as for the prophylaxis and treatment of patients with atrial fibrillation.

Anisindione is also indicated for the treatment of patients with a history of stroke or transient ischemic attack.

Anisindione is also indicated for the treatment of patients with a history of deep vein thrombosis or pulmonary embolism.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of deep vein thrombosis or pulmonary embolism.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of stroke or transient ischemic attack.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of unstable angina or myocardial infarction.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of atrial fibrillation.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of deep vein thrombosis.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of pulmonary embolism.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of atrial fibrillation.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of unstable angina.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of myocardial infarction.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of atrial fibrillation.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of stroke.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of transient ischemic attack.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of deep vein thrombosis.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of pulmonary embolism.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of atrial fibrillation.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of unstable angina.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of myocardial infarction.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of atrial fibrillation.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of stroke.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of transient ischemic attack.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of deep vein thrombosis.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of pulmonary embolism.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of atrial fibrillation.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of unstable angina.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of myocardial infarction.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of atrial fibrillation.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of stroke.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of transient ischemic attack.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of deep vein thrombosis.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of pulmonary embolism.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of atrial fibrillation.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of unstable angina.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of myocardial infarction.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of atrial fibrillation.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of stroke.

Anisindione is also indicated for the treatment of patients with a history of cancer and a history of transient ischemic attack.
Vitamin K1 is a specific antidote for the use of oral anticoagulants in pregnancy.

Fertility: Possible hemorrhagic complications following oral anticoagulant therapy. For additional discussion of possible effects which do not occur with adequate anticoagulant and are the main serious complications, see Contraindications and Drug Interactions.

HOW SUPPLIED

MIRADON Tablets are pink scored, enteric coated, round tablets of which each contains 150 mg of vitamin K1...
